ScopeCheck teammate brief

AI for Product Management Workflows | PMAI Hack For Impact | October 17 2026

Review a proposed change in an AI feature before the team commits to implementation.

The problem

A change in AI authority can leave the product requirement, implementation tickets, tests and reporting rules inconsistent. We are building a review step that makes the implications and unchanged rules visible.

The demo

A support assistant moves from drafting all replies to automatically sending only eligible shipping-status answers. Refunds, account security and uncertain cases still need human review. Analyze eight fictional artifacts; inspect evidence; edit and approve a proposal; export the reviewed handoff.

What we will build

One web app with a change request, source cards, evidence-linked findings, accept/edit/reject controls and Markdown export. No live customer messages or ticketing integrations. Proposed stack: Next.js, TypeScript, Tailwind, Gemini structured outputs, Zod and localStorage. Antigravity assists development.

Who I am looking for

One builder comfortable with Next.js and API integration. A second teammate could own interface design, review state and export. Bhavi leads scope, workflow, evaluation and pitch, and contributes to implementation. Team size follows the announced event rules.

What makes the demo persuasive

Show a semantic dependency, preserve two human-review exceptions, leave an unrelated workflow untouched, and prove that the export reflects human decisions. Measure missed impacts, false alarms and review effort. These are planned targets; no prototype results exist yet.

Recruitment pitch

I'm building ScopeCheck for the AI product management track. When a team changes what an AI feature is allowed to do, its tickets, tests, and review rules can become inconsistent. Our tool reviews a change against those documents, shows the evidence for affected work, and lets a PM approve proposed updates. Our demo changes a support assistant from drafting replies to automatically sending only shipping-status answers, while preserving human review for refunds and account security. I'm looking for a teammate comfortable with Next.js and API integration, and ideally someone who enjoys product design or testing. I'll lead scope, workflow design, evaluation, and contribute to the build.
